

Visit Check-In App

Team Kickoff

Prepared by Jude Omo-Ojugo · Kickoff meeting reference document

1. What We're Building

An app that lets members of RCCG Victory House mark themselves present at services automatically. Members register once by scanning a QR code, and after that the app checks them in on its own whenever they arrive — no line, no manual scan every week.

Three pieces make up the system:

- Member app (mobile) — registration, permissions, automatic and manual check-in
- Admin dashboard (web) — live attendance, service history, member directory, settings
- Backend (Supabase) — database, access control, and the logic that ties it together

2. How It Works

First-time registration

1. Member opens the app for the first time
2. Scans the QR code at the front desk — this links their phone to their member record
3. Confirms their contact details, including how many children are checking in with them
4. Reviews and grants (or declines) location/Bluetooth permission for automatic check-in
5. Device is paired and ready — or, if permission was declined, manual check-in becomes their default path

Every visit after that

6. App runs quietly in the background — nothing for the member to do
7. Member enters the church's geofence (or beacon range, depending on which we choose)
8. Phone detects proximity and an automatic check-in is recorded, including any children counted at registration
9. Member gets a quiet confirmation notification
10. Attendance shows up live on the admin dashboard for staff

Anyone without a smartphone, or who declines permissions, still has a full path: manual check-in from their own phone, or staff checking them in directly from the admin dashboard.

3. Architecture & Tech Stack

Layer	Choice	Why
-------	--------	-----

Member app	React Native (Expo)	One codebase for iOS + Android, strong location/camera plugin support
Admin dashboard	React + Vite + Tailwind	Lightweight, fast to build, no native dependencies
Database & API	Supabase (Postgres)	Hosted Postgres, auto-generated API, built-in row-level security, realtime
Custom logic	Supabase Edge Functions	Registration + check-in dedup logic lives server-side, not trusted to the client
Mobile builds	EAS Build (Expo)	Handles iOS/Android signing without needing a Mac for iOS
Hosting (dashboard)	Vercel / Netlify	Free tier, auto-deploy from GitHub

Database at a glance

Table	Purpose
members	One row per person — identity, contact info, consent timestamp, children count
devices	Pairs a member to a specific phone, tracks permission status
services	The church's schedule — Sunday service, Bible study, etc.
check_ins	One row per visit — links member, device, and service together

Full schema, ER diagram, and API details live in the technical specification document — see Resources at the end of this doc.

4. Where Things Stand

The project is tracked stage by stage — Requirement Gathering → Planning/Design → Development → Testing → Deployment → Maintenance — on the shared project tracker (link in Resources). That board is the live source of truth; treat the summary below as a snapshot as of this document, not the current state.

Decided so far

- Tech stack: React Native + Expo (member app), React + Vite (dashboard), Supabase (backend)
- Children without their own devices are counted at registration and check in automatically with a parent, rather than requiring their own device or record
- Manual check-in is a required path, not optional — for anyone without a smartphone or who declines permissions

Still open — needs a decision at or before kickoff

- Check-in method: QR-only, or QR + NFC as a second option
- Geofencing (GPS-based) vs. Bluetooth beacons for automatic detection — affects hardware cost and indoor precision
- Data privacy and retention policy for attendance records — needs to be settled before real member data enters the system

5. Team & Roles

To fill in during kickoff:

Name	Role	Primary focus
Jude Omo-Ojugo	Technical Product Manager	Ensures the product aligns with business
Abiola Madojekumi	Solutions Architect	Architecting/Tech Stack
Frank Omoike	QA Tester	Manual/Automated testing
Muesiri Djebah	Senior Cybersecurity Consultant	Security and Privacy Frameworks

6. Immediate Next Steps

11. Resolve the three open decisions above
12. Assign owners to Planning/Design tasks on the tracker
13. Set up each team member's local dev environment (member app + dashboard)
14. Write the two Edge Functions the check-in flow depends on: register-device and record-checkin
15. Target a small internal pilot — a handful of real check-ins — before wider rollout
